Sure-Stop Track Mounting Instructions

The following instructions can be used to assist you in proper installation of your Cisco Sure-Stop Track as improper installation may cause damage to your boat. Please take precautions and proper care when installing your track to prevent injury. Installation and location when mounting the track may vary from boat to boat.

1. When preparing to install your track system please be sure that the location you select is where you intend it to be permanently mounted and make sure that the track is in contact along the entire length of the gunnel. Additionally make sure that before you drill any holes in the gunnel it will not interfere with anything on the underneath side of the gunnel.
2. When the track is in position drill through the center most holes and place a stainless steel screw through the track and gunnel to keep the track in position so all remaining holes line up correctly.
3. Drill the remaining holes and mount it using the stainless steel screws secured by the stainless fender washer and nylon lock-nut on the underneath side of the gunnel. We recommend using our aluminum backing plates (Product Code: XPBKP-TRK) to ensure that your gunnel is secured with the greatest strength.

Your installation is now complete.

For your convenience we have provided you with a photo of the track below. If you have any questions during the installation please contact us and we will assist you as promptly as possible.
